Warning: I tried to do my best with verifying that my connections are correct. But please don't rely on this diagram to 100% and make sure that your connections are ok.

When it comes to troubleshooting remove everything and add one item at a time. Verify everything. Add items until you run into trouble and then investigate the last added item!

In principle, you can always connect both lines to the fuse boxes. But since they ultimately merge anyway, you can simply take a common terminal and take gnd from it. Since only the positive line has a fuse.

The connected electronic components are always connected to the respective voltage converter with 2 lines (positive & negative).

The common ground connection is shown as a dashed line.
